

September 16, 2011

New firmware service release version 1.25 for the Phase One 645 DF Camera body.

Firmware version in the 645DF camera body can be checked on the LCD screen of the camera by selecting custom function 99.

Firmware version 1.25 is a service release and only corrects a minor issue where the 645DF camera (set to half steps) would skip f/4 setting on the new Phase One 150mmLS.

Fixes included if you update from firmware older than 1.23:

1. Host capture from Capture One was not possible when using C1, C2 or C3.
2. The Phase One 645DF would at very rare occasions freeze on f/1 (removing the lens and putting it back on would correct the issue)
3. Improved flash timing when using fast flash generators and fast shutter speeds.
4. Improved stability when working with manual focus lenses and mirror up.
5. Auto focus occurred between each capture when using bracketing and autofocus was moved to the AEL button.

You can update your firmware in the Phase One 645DF camera by using the USB port on your V – Grip Air – If you do not have the V-Grip Air, please contact your local Phase One dealer, in order to get your camera body upgraded to latest version

For more information about how to upgrade the camera body using the V-Grip Air, please read the following Knowledge Base article

<http://www.phaseone.com/en/search/article.aspx?articleid=1914&languageid=1>

If you do not have access to a Phase One V-Grip, please ask your dealer for help updating your 645DF camera.
